DETAILED ACTION

Response to Amendment

1. Applicant's request for reconsideration of the finality of the rejection of the last Office action is persuasive and, therefore, the finality of that action is withdrawn.

Allowable Subject Matter

2. The following is an examiner's statement of reasons for allowance:

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

Claims 2-4, 15-19, and 20-25 are allowed over the prior art of record.

Independent claims 17 and 23 are allowable since they recite a helical scan system capable of writing or reading signal simultaneously to or from a plurality of tracks while winding a magnetic tape around a rotary drum, comprising one multitrack write head has N (N being an integer of 2 or more) write elements arranged in the track width direction, one multitrack read head has N or L (L being an integer greater than N) read elements arranged in the track width direction, wherein the write head comprises several thin film magnetic write elements formed on a substrate, and wherein the magnetic read head comprises several magnetoresistive effect elements are formed on the substrate, wherein **the multitrack write head forms signal tracks of M (M being an integer of 2 or more) groups each consisting of N (N being an integer of 2 or more) signal tracks aligned parallel on the magnetic tape during one rotation of**

the rotary drum, wherein the parallel N signal tracks of one of M groups have an identical azimuth angle, and azimuth angles of the adjacent groups each consisting of the N signal tracks are different from each other.

The closest prior art by Usui (US Pat. No. 6,172,831 B1) discloses a magnetic recording and reproducing device of helical scan capable of writing and reading several track simultaneously comprising, several write head and several read head that are arranged along the track width direction. Usui does not disclose that the write head forms signal tracks of M (M being a integer of 2 or more) groups consisting of N signal tracks aligned parallel on the magnetic tape during one rotation of the rotary drum, wherein all the tracks have the same azimuth angle and azimuth angles of adjacent groups each consisting of N signal tracks are different from each other.
